CLOTHING MANAGEMENT SYSTEM

This system is used by customers who wants clothes based on their needs. The Users can simply search the clothes from the system and purchase it. Along with each clothes the system also recommends the matching accessories for that like ornaments, footwear and other desirable items. There is also a customization for clothes is available, which is done by a fashion designer and they can purchase it. An events-based searching for clothes are available hence customer can purchase outfits based on events. In this system cloths of several brands are also available.

There are mainly 3 users in the system and they are:

     i. Customers

    ii. Fashion designers

   iii. Admin

The customers can view the clothing items and simply purchase it or move to customize it as per their wish. Admin have the functionality of adding clothes to the system and can view payments and also maintain a page where brands current trends, launching products are displaying through a page. Designer can view the requests for customization from customers and can give feedbacks. Also Admin have the overall control over the system, provide trust signals to outfits and maintain stock of clothes by brands if their products are over.

The system have the functionality of shopping and customization of clothes along with suitable accessories. To know the latest trends and launching designs customer can visit the brands page maintained by admin and know about it. There is also event- based searching for outfits, like wedding, engagement, haldi and other major celebrations are added in these fields.

In the existing system there is a need to visit several websites or stores to purchase clothes, matching accessories and so on. And there is no any priority to customer's ideas, customers push to shop as per available outfits and also there is no any system available for customizing as per

our request through a designer. In the existing system searching and findings the suitable outfits may time consuming and customer needs to choose as it is.

In the designed system it combines several functionalities into a single system.

This system have several functionalities like:

- o Registration for customers

- o Purchase

- o Customization

- o Product adding by admin

- o Orders

- o Payment

- o Product search

Whenever the customer login to the system then they can purchase or customize their outfits and make payments, admin can view payments and add new outfits and its accessories into the system. Designer can view the request and payments from the customer. The outfits can purchases based on events also.

HTML, CSS, PHP, JS, MYSQL – are the technologies used.
